The "Sample Email Authentication" app does send an email, but I guess there is no place for me to configure a different SMTP server to send to, since this is probably configured globally for all users.
18-Jul-2024 08:28:PM by: Doug S

Hi - does anyone know if the "free APEX workspace" (url starting <https://apex.oracle.com/pls/apex/f/<workspaceid>>) is able to send emails? My company has been trying to understand an email issue and trying to test email sending from somewhere else to help understand it is on the APEX side or the email filter. Thank you!
18-Jul-2024 08:24:PM by: Doug S

Hi all! I am migrating application created in APEX 5.0 to APEX 20.2. Some pages contain one "Text field with autocomplete" item based on SQL query. This query returns the same dataset on APEX 5.0 and 20.2. In older version, this item works normally, but on APEX 20.2 this item has poor performance - entering some letters freezes entire app and it comes back after few minutes. Was it any important change in APEX since 5.0 which impacts this type of items? Maybe I am missing something?
18-Jul-2024 06:39:PM by: Wojciech Sowa

Hi 🐼skin-tone-2: I am having an issue with apex collection create_or_truncate procedure taking 30+ seconds to truncate the collection containing around 2000 rows. Has anybody had a similar issue and how did you resolve?
18-Jul-2024 03:01:PM by: Kyle Harris

Hi I want to hide the column - APEX\$ROW_ACTION but when I do it, it show dots... Do you have a solution?
18-Jul-2024 09:27:AM by: Yarden Avraham

hello sir, we have created one dynamic page and in that using html css we have created file upload functionality. No page item is used from upload type its dynamic using html css. In backend we have PISQL process that executes upload functionality request to object URL using static credentials we have to sent the document to PLSQL process AJAX call from java script, For upload document to object storage, we have created static web credentials and we are passing the credentials while requesting, because our object storage URL is not PAR, I'm trying to sent the document but to PLSQL process but it is taking in clob only, we have to use blob while requesting to object storage.
17-Jul-2024 08:08:AM by: ABHIJIT

Is there a way to get the correct styling for these "system" dialogs in place?
18-Jul-2024 11:30:PM by: Trev

Possible #orclapex bug! When using an anchor and success message within Link Builder, the anchor isn't placed at the end of URL but in the middle, between request parameters and success message. As a result, the page doesn't scroll to the anchored position. Any help?

Material Kanban Board (1.1.0)

Region Plug-in by Matthias Range

This plug-in allows easy integration of a Kanban board into your own application. Your business processes can be grouped and visualized clearly. With Drag'n Drop you can move the cards between a dynamic number of columns. Adjust the icons, colors and other attributes to your personal needs. Expand the cards with any HTML content to display more information and enable more functions.

DB versions: 11.2.0.1, 12.1.0.1, 12.2.0.1
APEX versions: 5.0.0.5, 1.0.5, 1.1.5, 1.2.5, 1.3.5, 1.4, 18.1, 18.2, 19.1, 19.2

APEX_STRING.SPLIT()

—

APEX_STRING.SPLIT

APEX_STRING è un package di APEX che contiene diverse procedure e funzioni per gestire stringhe

A noi interessa la funzione SPLIT

The screenshot shows the Oracle APEX interface. At the top, there's a toolbar with icons for undo, redo, search, and other functions. Below the toolbar, a SQL query is entered in a text area:

```
1 select /*+ cardinality (s, 2) */ s.*
2 from apex_string.split('452:330:164:163:380',':') s
3
```

Below the query, there are tabs for 'Risultati', 'Spiega', 'Descrivi', 'SQL salvato', and 'Cronologia'. The 'Risultati' tab is selected, showing a table with one column named 'COLUMN_VALUE'. The table contains five rows of data: 452, 330, 164, 163, and 380. At the bottom of the results, it says '5 righe restituite in 0,01 secondi' and there is a 'Scarica' button.

COLUMN_VALUE
452
330
164
163
380

```
select column_value from apex_string.split('452:330:164:163:380',':');
```

Versione ottimizzata con performance maggiori

```
select /*+ cardinality (s, 20) */ column_value
from apex_string.split('452:330:164:163:380',':') s;
```
